

## Framing a Picture

---

1. Naturally first adjust exposure etc. Original picture at left
2. Duplicate the original background layer by hitting control J.
3. Under Edit select 'transform' and hold the 'shift' key while you adjust the size of the duplicate copy. That way you can change the size and it will stay in proportion.
4. Center this image on the background.
5. Going to the edit menu again, choose a color from the picture and add a stroke to this transformed layer.
6. Now reselect the background layer and going to Filter Menu, blur it or add noise or anything else you think of to create the frame.
7. Merge the two layers together and then save.
